

---

If giving access to instructors and students, some limitation rights should be introduced to the system. In this situation, there are four groups, which are user, scheduler, registrar, and superuser respectively. Instructors and students belong to user group. All list pages and detail pages should be accessible to instructors and students. However, instructors should have writing permission to only course pages and students should have writing permission to only registration pages. For other pages, instructors and students should only have view permission.

We definitely need to consider the extent to which the content on the page refers to them or to other people. For example, when a scheduler deletes a course, all sections referring to this course and all registrations referring to this course should be handled first.

All fields of the pages should be made accessible to all groups but writing permission of various pages should be only granted to the group who has the responsibility of the field. All groups should have read permission to all fields of the system.

Django view.py file combines model objects and templates. If authentication and authorization features are introduced to this system, view.py file will be the key place to implement the functionality of these features.
