

Django-crispy-forms is a module that can be integrated with Django framework to help program developers control the rendering behavior of Django forms. This module can generate elegant and dry forms without needing to create form templates in hand. This function can be implemented with the help of `|crispy` filter and `{% crispy %}` tag.

The `|crispy` filter can use django-crispy-forms elegantly `div` based fields to render a form or formset like the following code:

```
1 {% load crispy_forms_tags %}
2
3 <form method="post" class="uniForm">
4     {{ my_formset|crispy }}
5 </form>
```

Django-crispy-forms needs to be installed using `pip`:

```
1 pip install django-crispy-forms
```

The `{% crispy %}` tag can be integrated to the HTML template.

I'm not interested in using Django-crispy-forms in my final project since the final project is already a big challenge for me in this course and I'm not sure whether there will be bugs occurring in the project if I integrate Django-crispy-forms into the final project. The best way to avoid debugging is to not use it. However, it is still beneficial to know this module since it contains many wonderful form templates to use.
