The process of using GCBVs to refactoring the view file is easy since I am very familiar with it.

I estimate the process of refactoring all views will not take me too much time to implement it.

In my final project, there is no view that do not lend themselves to using GCBVs since all the functionalities are covered by the GCBVs. There are only some functions that are needed to be implemented separately.

After applying the refactoring to GCBVs, about 300 lines of code will be eliminated from my final project.
