Title: Django for Beginners: Build Websites with Python and Django
Author: William S. Vincent
ISBN: 9781735467207

This book covers Django 4.0 and Python 3.10, which is a very suitable text for teaching Django 4. This book has project-based introduction to Django that is appropriate for both complete beginners who have never developed a website before and seasoned programmers looking for a fast-paced introduction to current web development and Django foundations.

This book covers the creation of five websites from the ground up, including a blog and a newspaper. Deployment, testing, environment variables, site customization, custom user models, emails, permissions, authorizations, and more are all covered. Thus, the book itself is a good introductory tutorial for Django beginners.

Although this book is also not a reference book, it is beginner-friendly for new web developers. Django is extremely well documented, so there is no need to contain many advanced Django features in the book.
