In the final project, item_list, addition_list, and time_list pages will include pagination feature because these are list pages and can generate many records with a few other objects. Other pages like seller_list, customer_list, and order_list contain not many records, so there is no need for them to include pagination feature.

Over 50 test instances will be generated to test the pagination feature because I will show up to 25 records in each page.

I will generate the test data values by hand. Since the project is closed to life, it is totally enough to generate the data from the life.

I will put the data in the list of dictionaries to automatically import them and define two adding and removing functions for the convenience of testing the project.
